A series (X_t) is said to be lagged if its time axis is shifted: shifting by \tilde{t} , lags gives the series $(X_{t-\tilde{t}})$. So r_t is the estimated autocorrelation at lag t ; it is also called the sample

time series are related in simple ways to series which are stationary. Two important examples of this are:
Trend models : The series we observe is the sum of a deterministic trend series and a stationary noise series. A simple example is the linear trend model: $Y_t = \beta_0 + \beta_1 t + \mu_t$. Another common trend model assumes that the series is the sum of a periodic (seasonal) effect and ...
